Assignment 5 – DAEN 328

Maya Brumbalow

Questions:

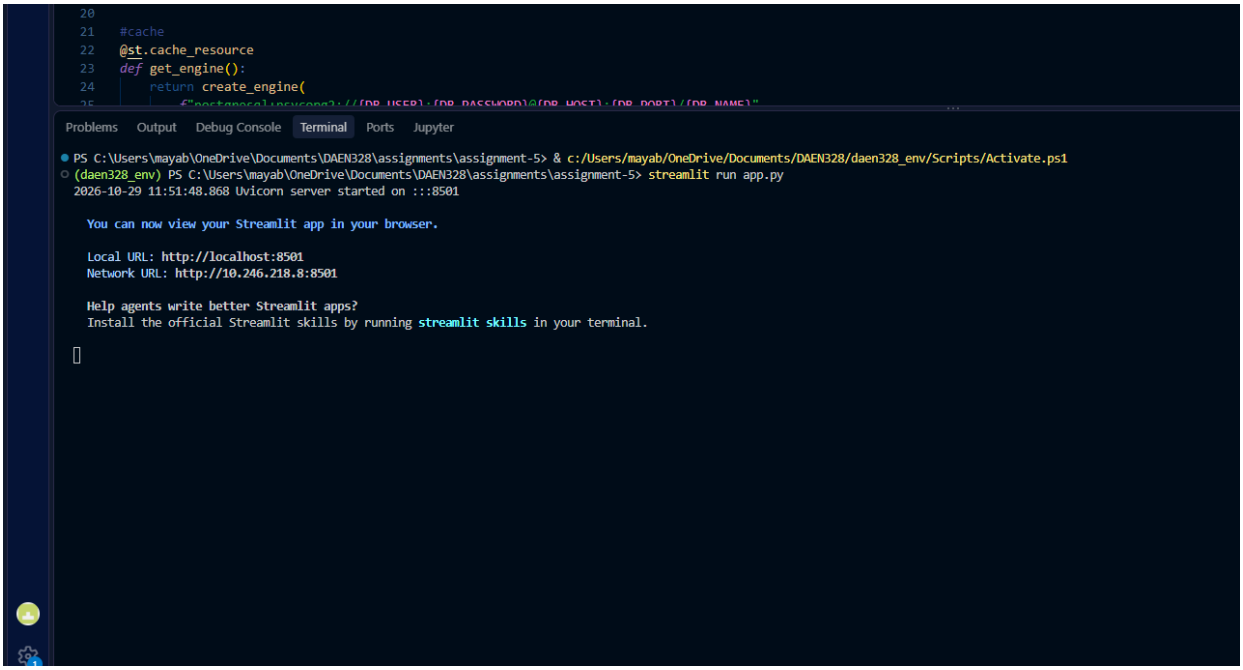

1) The average salary in the West Division is $44,329.77 and the median salary is $35,652.32. The values are so far apart because there are significant outliers in salary, with upper-level employees in the West Division being paid over $250,000. This has raised the mean salary beyond the median salary.

2) Without any filters, the salary box plot is hard to read because of the number of outliers. While many of the employees are paid around $35k, many executives and leads are paid multitudes more. These high-earning employees' outliers are marked as dots on the box plot, making the boxes themselves hard to interpret. To solve this, I filtered the salary to a range between the lowest salary and around $55k.

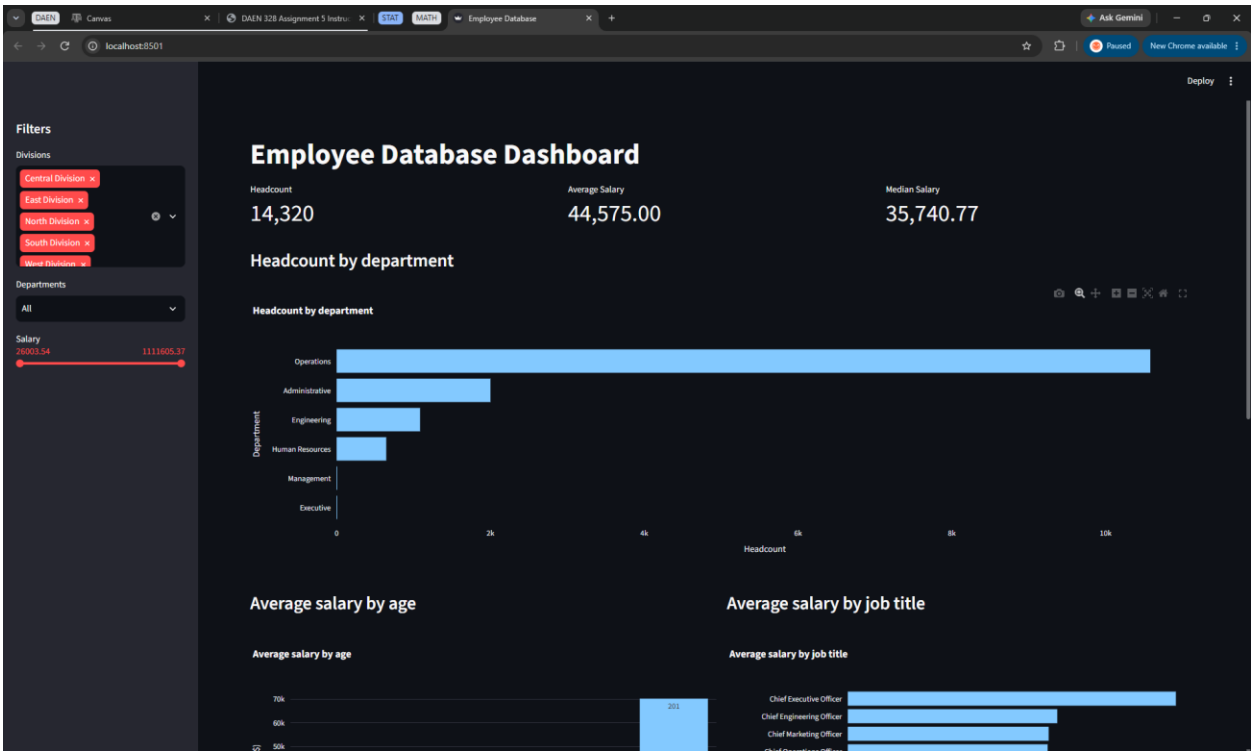

3) For both the whole company and the Operations Department, the 60+ age band has the highest average salary. In both situations, however, the 60+ age band has the lowest number of employees (there are 12 employees who are 60+ in the Operations Division). Even though there are so few of them, we can assume that the averages being reported on may be skewed because of the highly paid 60+ employees.
